(54) **PROCESS FOR POLYMERIZING OLEFIN.**

(57) A process for polymerizing olefin which comprises using a catalyst comprising a transition metal catalyst component, an aluminoxane component, and an organo-aluminum component. In this process, a catalyst containing a reduced amount of the above-described aluminoxane is used to attain an excellent polymerization activity. This process affords a polymer with a narrow molecular weight distribution, while it affords an olefin copolymer having a narrow molecular weight distribution and a narrow composition distribution in a copolymerization of two or more olefins.

- 1 -

## SPECIFICATION

## PROCESS FOR POLYMERIZING OLEFINS

## TECHNOLOGICAL FIELD

This invention relates to a process for polymerizing olefins. More specifically, it relates to a process for producing an olefin polymer of a narrow molecular weight distribution by polymerizing an olefin with a catalyst showing excellent polymerization activity using a small amount of an aluminoxane, which when applied to the copolymerization of at least two olefins, can give a copolymer having a narrow molecular weight distribution and a narrow composition distribution.

## BACKGROUND TECHNOLOGY

## [Prior Art]

For the production of an alpha-olefin polymer, particularly an ethylene polymer or an ethylene/alpha-olefin copolymer, methods have previously been known in which ethylene is polymerized, or ethylene and an alpha-olefin are copolymerized, in the presence of a titanium-containing catalyst comprising a titanium compound and an organoaluminum compound or a vanadium-containing catalyst comprising a vanadium compound and an organoaluminum compound. Generally, ethylene/alpha-olefin copolymers obtained with titanium-type catalysts have a broad molecular weight distribution and a broad composition distribution and inferior transparency, surface non-adhesiveness, and mechanical properties. Ethylene/alpha-olefin copolymers obtained with vanadium-type catalysts have a narrower molecular weight distribution and a narrower composition distribution and are considerably improved in transparency, surface non-adhesiveness, and mechanical properties, but are still insufficient for uses which require these properties. Accordingly, alpha-olefin polymers, especially ethylene/alpha-olefin copolymers, improved in these properties are required.

On the other hand, catalysts comprising a

- 2 -

zirconium compound and an aluminoxane have been proposed recently as a new type of Ziegler catalyst for olefin polymerization.

- Japanese Laid-Open Patent Publication No. 19309/1983 discloses a process which comprises polymerizing ethylene and at least one alpha-olefin having 3 to 12 carbon atoms at a temperature of  $-50^{\circ}\text{C}$  to  $200^{\circ}\text{C}$  in the presence of a catalyst composed of a transition metal-containing catalyst represented by the following formula

- wherein  $\text{R}^1$  represents cyclopentadienyl,  $\text{C}_1\text{-C}_8$  alkyl or halogen, Me represents a transition metal, and Hal represents halogen,
- with a linear aluminoxane represented by the following formula

- wherein  $\text{R}^2$  represents methyl or ethyl, and n is a number of 4 to 20,
- or a cyclic aluminoxane represented by the following formula

wherein  $\text{R}^2$  and n are as defined above.

- This patent document states that in order to adjust the density of the resulting polyethylene, ethylene should be polymerized in the presence of a small amount (up to 10 % by weight) of a slightly long-chain alpha-olefin or a mixture thereof.

- Japanese Laid-Open Patent Publication No. 95292/1984 describes an invention relating to a process

$$\begin{array}{c} R^3 \\ \diagdown \\ R^3 \end{array} Al - O - \overset{\overset{R^3}{|}}{Al} - O \Bigg\} _n - Al \begin{array}{c} \diagup R^3 \\ \diagdown R^3 \end{array}$$
$$\boxed{\begin{array}{c} \text{R}^3 \\ | \\ (\text{Al}-\text{O})_{n+2} \end{array}}$$
$$\begin{array}{c} \text{R}^4 \\ \diagdown \\ \text{Al}-\text{O}-(\underset{\text{R}^4}{\overset{|}{\text{Al}}}-\text{O})_n-\text{Al} \begin{array}{l} \diagup \text{R}^4 \\ \diagdown \text{R}^0 \end{array} \\ \diagup \text{R}^0 \end{array}$$

20 wherein  $R^4$  represents  $C_1$ - $C_{10}$  alkyl, and  $R^O$  is  
 $R^4$  or is bonded to represent  $-O-$ ,  
 with a magnesium compound, then chlorinating the reaction  
 product, and treating the chlorinated product with a  
 compound of Ti, V, Zr or Cr. The above Publication  
 25 describes that the above catalyst is especially suitable

- 4 -

for the copolymerization of ethylene with a  $C_3-C_{12}$  alpha-olefin mixture.

Japanese Laid-Open Patent Publication No. 35006/1985 discloses a combination of (a) a mono-, di- or tri-cyclopentadienyl compound of at least two different transition metals or its derivative with (b) alumoxane (aluminoxane) as a catalyst system for polymers blended in a reactor. Example 1 of this Publication discloses that polyethylene having a number average molecular weight of 15,300 and a weight average molecular weight of 36,400 and containing 3.4 % of a propylene component was obtained by polymerizing ethylene and propylene using bis(pentamethylcyclopentadienyl) dimethyl zirconium and alumoxane as a catalyst. In Example 2 of this Publication, a blend of polyethylene and an ethylene/propylene copolymer having a number average molecular weight of 2,000, a weight average molecular weight of 8,300 and a propylene component content of 7.1 mole % and consisting of a toluene-soluble portion having a number average molecular weight of 2,200, a weight average molecular weight of 11,900 and a propylene component content of 30 mole % and a toluene-insoluble portion having a number average molecular weight of 3,000, a weight average molecular weight of 7,400 and a propylene component content of 4.8 mole % was obtained by polymerizing ethylene and propylene using bis(pentamethylcyclopentadienyl)zirconium dichloride, bis(methylcyclopentadienyl)zirconium dichloride and alumoxane as a catalyst. Likewise, Example 3 of this Publication describes a blend of LLDPE and an ethylene/propylene copolymer composed of a soluble portion having a molecular weight distribution ( $\bar{M}_w/\bar{M}_n$ ) of 4.57 and a propylene component content of 20.6 mole % and an insoluble portion having a molecular weight distribution of 3.04 and a propylene component content of 2.9 mole %.

Japanese Laid-Open Patent Publication No.

- 5 -

35007/1985 describes a process which comprises polymerizing ethylene alone or with an alpha-olefin having at least 3 carbon atoms in the presence of a catalyst system comprising metallocene and a cyclic alumoxane represented  
 5 by the following formula

wherein  $\text{R}^5$  represents an alkyl group having 1 to 5 carbon atoms, and  $n$  is an integer of 1 to about 20,

10 or a linear alumoxane represented by the following formula

wherein  $\text{R}^5$  and  $n$  are as defined above.

The Publication describes that the polymer obtained by  
 15 the above process has a weight average molecular weight of about 500 to about 1,400,000 and a molecular weight distribution of 1.5 to 4.0.

Japanese Laid-Open Patent Publication No. 35008/1985 describes that polyethylene or a copolymer of  
 20 ethylene and a  $\text{C}_3$ - $\text{C}_{10}$  alpha-olefin having a wide molecular weight distribution is produced by using a catalyst system comprising at least two types of metallocenes and alumoxane. The Publication states that the above copolymer has a molecular weight distribution ( $\bar{M}_w/\bar{M}_n$ ) of  
 25 2 to 50.

These catalysts formed from transition metal compounds and aluminoxanes have much higher polymerization activity than the catalyst systems known heretofore.

On the other hand, methods using catalysts  
 30 formed from solid catalyst components composed of the

- 6 -

above transition metal compounds supported on porous inorganic oxide carriers such as silica, silica-alumina and alumina and aluminoxanes are proposed in Japanese Laid-Open Patent Publications Nos. 35006/1985, 35007/1985  
 5 and 35008/1985 which are cited above. Japanese Laid-Open Patent Publications Nos. 31404/1986, 108610/1986 and 106808/1985 propose methods using solid catalyst components supported on similar porous inorganic oxide carriers.

10 Furthermore, Japanese Laid-Open Patent Publications Nos. 260602/1985 and 130604/1985 propose a process for polymerizing olefins using catalysts formed from a transition metal compound and a mixed organo-aluminum compound composed of an aluminoxane and an  
 15 organoaluminum compound.

Japanese Laid-Open Patent Publication No. 260602/1985 discloses a process for producing a polyolefin by polymerizing an olefin using

20 (1) as the transition metal compound, a compound of the following formula

wherein Cp is cyclopentadienyl, M is Ti, V, Zr or Hf, and each of  $\text{R}^6$ ,  $\text{R}^7$  and  $\text{R}^8$  represents  $\text{C}_1$ - $\text{C}_6$  alkyl, cyclopentadienyl, halogen or  
 25 hydrogen, and

(2) as the organoaluminum compounds,

(2)-1 an aluminoxane synthesized from a trialkylaluminum and water and

(2)-2 a compound of the following formula

wherein  $\text{R}^9$  is  $\text{C}_1$ - $\text{C}_{10}$  alkyl, cycloalkyl or aryl, X is halogen, and n is a number of 1 to 3.

- 7 -

This Laid-Open Patent Publication gives a working example in which ethylene is polymerized in a system comprising 3 millimoles of the aluminoxane, 3 millimoles of triethyl-aluminum and 0.003 millimole of bis(cyclopentadienyl)-  
 5 zirconium chloride in 400 ml of toluene as a polymerization medium.

Japanese Laid-Open Patent Publication No. 130604/1985 discloses a process for producing a poly-olefin by polymerizing an olefin using a catalyst com-  
 10 posed of, as main components,

(1) a transition metal compound of the following formula

wherein Cp is cyclopentadienyl, M is Ti, Zr or  
 15 Hf, and each of  $\text{R}^{10}$  and  $\text{R}^{11}$  is H, halogen,  $\text{C}_1\text{-C}_6$  alkyl or cyclopentadienyl,

(2) an aluminoxane obtained by reacting a dialkyl monohalide of the formula

wherein  $\text{R}^{12}$  is methyl or ethyl, and  $\text{X}^1$  is  
 20 halogen,

with water, and

(3) an organoaluminum compound represented by the following formula

wherein  $\text{R}^{13}$  is  $\text{C}_1\text{-C}_{10}$  alkyl or cycloalkyl,  $\text{X}^2$  is halogen, and m is a number of 1 to 3.

This Laid-Open Patent Publication gives examples of the amounts of the aluminoxane used per 400 ml of toluene as  
 30 a polymerization medium, 4.5 millimoles (Examples 1-4

- 8 -

and 8), 3.6 millimoles (Example 5), 3.25 millimoles (Example 6), 10.0 millimoles (Example 7) and 9.0 millimoles (Example 9).

It is an object of this invention to provide a process for producing an alpha-olefin polymer having a narrow molecular weight distribution and a copolymer of alpha-olefins having a narrow molecular weight distribution and a narrow composition distribution when applied to the copolymerization of at least two olefins, especially a high-molecular-weight ethylene/alpha-olefin copolymer having a narrow molecular weight distribution and a narrow composition distribution, with excellent polymerization activity using a small amount of an aluminoxane.

Another object of this invention relates to a process for producing an olefin polymer having excellent powder properties and a narrow molecular weight distribution, and an olefin copolymer having a narrow molecular weight distribution and a narrow composition distribution when applied to the copolymerization of at least two olefins, especially an ethylene polymer or an ethylene/alpha-olefin copolymer having excellent powder properties and a narrow molecular weight distribution and/or a narrow composition distribution.

## DISCLOSURE OF THE INVENTION

According to this invention, these objects and advantages of this invention are firstly achieved by a process for polymerizing olefins, which comprises polymerizing or copolymerizing olefins in the presence of a catalyst composed of

(A) a solid catalyst component composed of a compound of a transition metal of Group IVB of the periodic table supported on an inorganic carrier,

(B) an aluminoxane, and

(C) an organoaluminum compound having a hydrocarbon group other than n-alkyl groups.

- 9 -

The catalyst in accordance with this invention is formed of the solid catalyst component (A), the aluminoxane (B) and the organoaluminum compound (C) having a hydrocarbon group other than n-alkyl groups.

- 5 The catalyst component (A) is a solid catalyst component composed of a carrier and a compound of a transition metal of Group IVB of the periodic table supported on it.

- 10 The transition metal of Group IVB of the periodic table in the catalyst component (A) is preferably selected from the group consisting of titanium, zirconium and hafnium. Titanium and zirconium are more preferred, and zirconium is especially preferred.

- 15 The compound of a transition metal of Group IVB of the periodic table in the catalyst component (A) preferably has a group with a conjugated  $\pi$ -electron as a ligand.

Examples of the transition metal compound having a group with a conjugated  $\pi$ -electron as a ligand are compounds represented by the following formula (I)

- wherein  $\text{R}^1$  represents a cycloalkadienyl group,  $\text{R}^2$ ,  $\text{R}^3$  and  $\text{R}^4$  are identical or different and each represents a cycloalkadienyl group, an aryl group, an alkyl group, a cycloalkyl group, an aralkyl group, a halogen atom, a  
25 hydrogen atom, or a group of the formula  $-\text{OR}^a$ ,  $-\text{SR}^b$  or  $-\text{NR}_2^c$  in which each of  $\text{R}^a$ ,  $\text{R}^b$  and  $\text{R}^c$  represents an alkyl group, a cycloalkyl group, an aryl group, an aralkyl group or an organic silyl group, Me represents zirconium, titanium or hafnium, k is 1, 2, 3 or 4, l, m and n are  
30 each 0, 1, 2 or 3, and  $k+l+m+n=4$ .

Examples of the cycloalkadienyl group represented by  $\text{R}^1$  are a cyclopentadienyl group, a methylcyclopentadienyl group, an ethylcyclopentadienyl group, a

- 10 -

dimethylcyclopentadienyl group, an indenyl group and a tetrahydroindenyl group. Examples of the cycloalkadienyl group represented by  $R^2$ ,  $R^3$  and  $R^4$  may be the same as above.

5           The aryl group represented by  $R^2$ ,  $R^3$  and  $R^4$  is preferably a phenyl or tolyl group, for example.

Likewise, preferred examples of the aralkyl group are benzyl and neophyle groups.

10           Examples of preferred alkyl groups are methyl, ethyl, propyl, isopropyl, butyl, hexyl, octyl, 2-ethyl-hexyl, decyl and oleyl groups.

Preferably, the cycloalkyl group may be, for example, a cyclopentyl, cyclohexyl, cyclooctyl, or norbornyl group.

15           The halogen atom may be, for example, fluorine, chlorine or bromine.

Specific examples of the groups  $-OR^a$ ,  $-SR^b$  and  $-NR_2^c$  where  $R^a$ ,  $R^b$  and  $R^c$  are alkyl, cycloalkyl, aryl and aralkyl will be clear from the above specific examples of these groups.

20           Examples of the organic silyl group for  $R^a$ ,  $R^b$  and  $R^c$  are trimethylsilyl, triethylsilyl, phenyldimethylsilyl, diphenylmethylsilyl and triphenylsilyl groups.

25           Examples of zirconium compounds corresponding to formula (I) in which Me is zirconium are listed below.

bis(Cyclopentadienyl)zirconium monochloride monohydride,

bis(cyclopentadienyl)zirconium monobromide monohydride,

30           bis(cyclopentadienyl)methylzirconium hydride,  
bis(cyclopentadienyl)ethylzirconium hydride,  
bis(cyclopentadienyl)cyclohexylzirconium hydride,

35           bis(cyclopentadienyl)phenylzirconium hydride,  
bis(cyclopentadienyl)benzylzirconium hydride,  
bis(cyclopentadienyl)neopentylzirconium hydride,

- 11 -

- bis(methylcyclopentadienyl)zirconium mono-  
chloride monohydride,  
bis(indenyl)zirconium monochloride monohydride,  
bis(cyclopentadienyl)zirconium dichloride,  
5 bis(cyclopentadienyl)zirconium dibromide,  
bis(cyclopentadienyl)methylzirconium mono-  
chloride,  
bis(cyclopentadienyl)ethylzirconium mono-  
chloride,  
10 bis(cyclopentadienyl)cyclohexylzirconium mono-  
chloride,  
bis(cyclopentadienyl)phenylzirconium mono-  
chloride,  
bis(cyclopentadienyl)benzylzirconium mono-  
15 chloride,  
bis(methylcyclopentadienyl)zirconium di-  
chloride,  
bis(indenyl)zirconium dichloride,  
bis(indenyl)zirconium dibromide,  
20 bis(cyclopentadienyl)diphenylzirconium,  
bis(cyclopentadienyl)dibenzylzirconium,  
bis(cyclopentadienyl)methoxyzirconium chloride,  
bis(cyclopentadienyl)ethoxyzirconium chloride,  
bis(cyclopentadienyl)butoxyzirconium chloride,  
25 bis(cyclopentadienyl)2-ethylhexoxyzirconium  
chloride,  
bis(cyclopentadienyl)methylzirconium ethoxide,  
bis(cyclopentadienyl)methylzirconium butoxide,  
bis(cyclopentadienyl)ethylzirconium ethoxide,  
30 bis(cyclopentadienyl)phenylzirconium ethoxide,  
bis(cyclopentadienyl)benzylzirconium ethoxide,  
bis(methylcyclopentadienyl)ethoxyzirconium  
chloride,  
bis(indenyl)ethoxyzirconium chloride,  
35 bis(cyclopentadienyl)ethoxyzirconium,  
bis(cyclopentadienyl)butoxyzirconium,

- 12 -

bis(cyclopentadienyl)2-ethylhexoxyzirconium,  
bis(cyclopentadienyl)phenoxyzirconium chloride,  
bis(cyclopentadienyl)cyclohexoxyzirconium  
chloride,  
5 bis(cyclopentadienyl)phenylmethoxyzirconium  
chloride,  
bis(cyclopentadienyl)methylzirconium phenyl-  
methoxide,  
bis(cyclopentadienyl)trimethylsiloxyzirconium  
10 chloride,  
bis(cyclopentadienyl)triphenylsiloxyzirconium  
chloride,  
bis(cyclopentadienyl)thiophenylzirconium  
chloride,  
15 bis(cyclopentadienyl)thioethylzirconium  
chloride,  
bis(cyclopentadienyl)bis(dimethylamide)-  
zirconium,  
bis(cyclopentadienyl)diethylamidezirconium  
20 chloride,  
ethylenebis(indenyl)ethoxyzirconium chloride,  
ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
ethoxyzirconium chloride,  
ethylenebis(indenyl)dimethylzirconium,  
25 ethylenebis(indenyl)diethylzirconium,  
ethylenebis(indenyl)dibenzylzirconium,  
ethylenebis(indenyl)methylzirconium mono-  
bromide,  
ethylenebis(indenyl)ethylzirconium mono-  
30 chloride,  
ethylenebis(indenyl)benzylzirconium mono-  
chloride,  
ethylenebis(indenyl)methylzirconium mono-  
chloride,  
35 ethylenebis(indenyl)zirconium dichloride,  
ethylenebis(indenyl)zirconium dibromide,

- 13 -

- ethylenebis(4,5,6,7-tetrahydro-1-indenyl)di-  
methylzirconium,  
ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
methylzirconium monochloride,  
5       ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
zirconium dichloride,  
ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
zirconium dibromide,  
ethylenebis(4-methyl-1-indenyl)zirconium di-  
10 chloride,  
ethylenebis(5-methyl-1-indenyl)zirconium di-  
chloride,  
ethylenebis(6-methyl-1-indenyl)zirconium di-  
chloride,  
15       ethylenebis(7-methyl-1-indenyl)zirconium di-  
chloride,  
ethylenebis(5-methoxy-1-indenyl)zirconium  
dichloride,  
ethylenebis(2,3-dimethyl-1-indenyl)zirconium  
20 dichloride,  
ethylenebis(4,7-dimethyl-1-indenyl)zirconium  
dichloride,  
ethylenebis(4,7-dimethoxy-1-indenyl)zirconium  
dichloride,  
25       ethylenebis(indenyl)zirconium dimethoxide,  
ethylenebis(indenyl)zirconium diethoxide,  
ethylenebis(indenyl)methoxyzirconium chloride,  
ethylenebis(indenyl)ethoxyzirconium chloride,  
ethylenebis(indenyl)methylzirconium ethoxide,  
30       ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
zirconium dimethoxide,  
ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
zirconium diethoxide,  
ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
35 methoxyzirconium chloride,  
ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
ethoxyzirconium chloride, and

- 14 -

ethylenebis(4,5,6,7-tetrahydro-1-indenyl)methyl-  
zirconium ethoxide.

Examples of titanium compounds corresponding to  
formula (I) in which Me is titanium are listed below.

- 5       bis(Cyclopentadienyl)titanium monochloride  
monohydride,  
      bis(cyclopentadienyl)methyltitanium hydride,  
      bis(cyclopentadienyl)phenyltitanium chloride,  
      bis(cyclopentadienyl)benzyltitanium chloride,  
10       bis(cyclopentadienyl)titanium chloride,  
      bis(cyclopentadienyl)dibenzyltitanium,  
      bis(cyclopentadienyl)ethoxytitanium chloride,  
      bis(cyclopentadienyl)butoxytitanium chloride,  
      bis(cyclopentadienyl)methyltitanium ethoxide,  
15       bis(cyclopentadienyl)phenoxytitanium chloride,  
      bis(cyclopentadienyl)trimethylsiloxytitanium  
chloride,  
      bis(cyclopentadienyl)thiophenyltitanium  
chloride,  
20       bis(cyclopentadienyl)bis(dimethylamide)-  
titanium,  
      bis(cyclopentadienyl)ethoxytitanium,  
      ethylenebis(indenyl)titanium dichloride, and  
      ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
25       titanium dichloride.

Examples of hafnium compounds corresponding to  
formula (I) in which Me is hafnium are listed below.

- bis(Cyclopentadienyl)hafnium monochloride  
monohydride,  
30       bis(cyclopentadienyl)ethylhafnium hydride,  
      bis(cyclopentadienyl)phenylhafnium chloride,  
      bis(cyclopentadienyl)hafnium dichloride,  
      bis(cyclopentadienyl)dibenzylhafnium,  
      bis(cyclopentadienyl)ethoxyhafnium chloride,  
35       bis(cyclopentadienyl)butoxyhafnium chloride,  
      bis(cyclopentadienyl)methylhafnium ethoxide,

- 15 -

bis(cyclopentadienyl)phenoxyhafnium chloride,  
bis(cyclopentadienyl)thiophenylhafnium  
chloride,

5 bis(cyclopentadienyl)bis(diethylamide)hafnium,  
ethylenebis(indenyl)hafnium dichloride, and  
ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
hafnium dichloride.

In the catalyst component (A), the IVB transi-  
tion metal compound may be treated with an organic metal  
10 compound or a halogen-containing silicon compound prior  
to deposition. The organic metal compound may be, for  
example, an organoaluminum compound, an organoboron  
compound, an organomagnesium compound, an organozinc  
compound or an organolithium compound. The organo-  
15 aluminum compound is preferred.

Examples of the organoaluminum compound include  
trialkylaluminums such as trimethylaluminum, triethyl-  
aluminum and tributylaluminum; alkenylaluminums such as  
isoprenylaluminum; dialkyl aluminum alkoxides such as  
20 dimethyl aluminum methoxide, diethyl aluminum ethoxide  
and dibutyl aluminum butoxide; alkyl aluminum sesqui-  
alkoxides such as methyl aluminum sesquimethoxide and  
ethyl aluminum sesquiethoxide; partially alkoxylated  
alkylaluminums having an average composition of the  
25 formula  $R_{2.5}^1Al(OR^2)_{0.5}$ ; dialkyl aluminum halides such as  
dimethyl aluminum chloride, diethyl aluminum chloride and  
dimethyl aluminum bromide; alkyl aluminum sesquihalides  
such as methyl aluminum sesquichloride and ethyl aluminum  
sesquichloride; partially halogenated alkylaluminums, for  
30 example alkyl aluminum dihalides such as methyl aluminum  
dichloride and ethyl aluminum dichloride.

The trialkylaluminums and dialkyl aluminum  
chlorides are preferred, and above all trimethylaluminum,  
triethylaluminum and dimethyl aluminum chloride are  
35 preferred.

Triethylboron is a preferred example of the  
organoboron compound.

- 16 -

Examples of the organomagnesium compound are ethylbutylmagnesium, di-n-hexylmagnesium, ethyl magnesium bromide, phenyl magnesium bromide and benzyl magnesium chloride.

5 Diethylzinc is a preferred example of the organozinc compound.

Methyl lithium, butyllithium and phenyllithium are examples of the organolithium compound.

10 An organoaluminum compound is preferred as the organic metal compound (C).

As the halogen-containing silicon compound as a treating agent, compounds of the following formula (IV)

15 wherein Y is a chlorine or bromine atom,  $\text{R}^5$  and  $\text{R}^6$ , independently from each other, represent an alkyl group having 1 to 12 carbon atoms, an aryl group, or a cycloalkyl group having 3 to 12 carbon atom,  $d$  is a number of 1 to 4 and  $e$  is a number of 0 to 4, provided that the sum of  $d$  and  $e$  is a number of 1 to 4,

20 are preferably used.

Examples of such compounds include silicon tetrachloride, silicon tetrabromide, silicon trichloride, methylsilicon trichloride, ethylsilicon trichloride, 25 propylsilicon trichloride, phenylsilicon trichloride, cyclohexylsilicon trichloride, silicon tribromide, ethylsilicon tribromide, dimethylsilicon dichloride, methylsilicon dichloride, phenylsilicon dichloride, methoxysilicon trichloride, ethoxysilicon trichloride, propoxy- 30 silicon trichloride, phenoxysilicon trichloride, ethoxysilicon tribromide, methoxysilicon dichloride, dimethoxysilicon dichloride, and silanol trichloride. These compounds may be used singly or in combination. Among them, silicon tetrachloride, silicon trichloride

- 17 -

and methylsilicon trichloride are preferred.

The mixing ratio of the organometallic compound to the inorganic carrier in the above treatment, as the ratio of the amount of the organometallic compound in  
5 millimoles/the amount of the carrier in grams, is from 0.5 to 50, preferably from 1 to 30, more preferably from 1.5 to 20.

The treatment of the inorganic carrier with the organometallic compound in the preparation of the cata-  
10 lyst component (A) can be carried out by dispersing the carrier in an inert solvent, adding at least one of the above-described organometallic compounds, and treating the carrier at a temperature of 0 to 120 °C, preferably 10 to 100 °C, more preferably 20 to 90 °C, for a period  
15 of 10 minutes to 10 hours, preferably 20 minutes to 5 hours, more preferably 30 minutes to 3 hours, under reduced or elevated pressure.

Examples of the inert solvent are aromatic hydrocarbons such as benzene, toluene and xylene,  
20 aliphatic hydrocarbons such as pentane, hexane and isooctane and alicyclic hydrocarbons such as cyclohexane.

In the above-treatment, the mixing ratio of the inorganic carrier to the halogen-containing silicon compound, is such that the halogen-containing silicon  
25 compound is used in an amount of 0.001 to 10 moles, preferably 0.01 to 50 moles, more preferably 0.05 to 1 mole, per gram of the carrier compound. Preferably, after the above treatment, the liquid portion containing the excess of the halogen-containing silane compound,  
30 etc. is removed from the reaction mixture by such a method as filtration or decantation.

The treatment of the inorganic carrier with the halogen-containing silicon compound in preparing the catalyst component (A) may be carried out at a tempera-  
35 ture of -50 to 200 °C, preferably 0 to 100 °C, more preferably 20 to 70 °C, for a period of 10 minutes to

- 18 -

10 hours, preferably 20 minutes to 5 hours, under atmospheric, reduced or elevated pressure.

An inert solvent may be used in the above treatment. Examples of the inert solvent include  
5 aromatic hydrocarbons such as benzene, toluene and xylene, aliphatic hydrocarbons such as pentane, hexane, isooctane, decane and dodecane, alicyclic hydrocarbons such as cyclohexane and halogenated hydrocarbons such as chlorobenzene and ethylene dichloride.

10 In the deposition of the Group IVB transition metal compound on the inorganic carrier in the preparation of the catalyst component (A), an inert solvent needs not to be used when the transition metal compound is a liquid substance. If the transition metal compound  
15 is a solid substance at ordinary temperature, it is preferred generally to use an inert solvent capable of dissolving the transition metal compound.

The inert solvent used at this time may be the same inert solvent as that used in treating the inorganic  
20 carrier with the halogen-containing silicon compound. Aromatic hydrocarbons such as benzene and toluene and halogenated hydrocarbons such as chlorobenzene are especially preferred.

The amount of the transition metal compound  
25 used in the above supporting reaction is preferably 0.001 to 500 millimoles, more preferably 0.01 to 100 millimoles, especially preferably 0.1 to 50 millimoles, per gram of the inorganic carrier.

The amount of the inert solvent used in the  
30 above supporting reaction is preferably 0.5 to 1000 ml, more preferably 1 to 100 ml, especially preferably 2 to 50 ml, per gram of the inorganic carrier treated with the halogen-containing silane compound.

The above supporting reaction can be carried  
35 out by contacting and mixing the inorganic carrier and the transition metal compound at a temperature of 0 to

- 19 -

200 °C, preferably 0 to 100 °C, especially preferably 20 to 80 °C, for a period of 1 minute to 10 hours, 5 minutes to 5 hours, 10 minutes to 3 hours.

After the supporting reaction by the above  
5 method, it is preferred to remove the liquid portion of the reaction mixture by such a method as filtration or decantation and wash the residue several times with an inert solvent.

In the catalyst of this invention, the solid  
10 catalyst component (A) is obtained by supporting the compound of a transition metal of Group IVB of the periodic table on the carrier.

The inorganic carrier is advantageously a granular or fine particulate solid having a particle  
15 diameter of, for example, 10 to 300 micrometers, preferably 20 to 200 micrometers. Preferably, it is a porous oxide. Specific examples include  $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{MgO}$ ,  $\text{ZrO}_2$ ,  $\text{TiO}_2$ ,  $\text{B}_2\text{O}_3$ ,  $\text{CaO}$ ,  $\text{ZnO}$ ,  $\text{BaO}$ ,  $\text{ThO}_2$  and mixtures of these such as  $\text{SiO}_2$ - $\text{MgO}$ ,  $\text{SiO}_2$ - $\text{Al}_2\text{O}_3$ ,  $\text{SiO}_2$ - $\text{TiO}_2$ ,  
20  $\text{SiO}_2$ - $\text{V}_2\text{O}_5$ ,  $\text{SiO}_2$ - $\text{Cr}_2\text{O}_3$  and  $\text{SiO}_2$ - $\text{TiO}_2$ - $\text{MgO}$ . Carriers containing at least one component selected from the group consisting of  $\text{SiO}_2$  and  $\text{Al}_2\text{O}_3$  as a main component are preferred.

The inorganic oxides may contain small amounts  
25 of carbonates, sulfates, nitrates or oxide components such as  $\text{Na}_2\text{CO}_3$ ,  $\text{K}_2\text{CO}_3$ ,  $\text{CaCO}_3$ ,  $\text{MgCO}_3$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{Al}_2(\text{SO}_4)_3$ ,  $\text{BaSO}_4$ ,  $\text{KNO}_3$ ,  $\text{Mg}(\text{NO}_3)_2$ ,  $\text{Al}(\text{NO}_3)_3$ ,  $\text{Na}_2\text{O}$ ,  $\text{K}_2\text{O}$  and  $\text{Li}_2\text{O}$ .

The porous inorganic carrier have different properties depending upon its type and the method of  
30 production. Carriers preferably used in this invention have a specific surface area of 50 to 1000  $\text{m}^2/\text{g}$ , preferably 100 to 700  $\text{m}^2/\text{g}$  and a pore volume of 0.3 to 2.5  $\text{cm}^3/\text{g}$ . The above carrier is used after it is calcined at a temperature of usually 150 to 1000 °C, preferably 200  
35 to 800 °C.

In the catalyst component (A) in this

invention, the compound of the transition metal of Group IVB of the periodic table is supported in an amount of  $3 \times 10^{-3}$  to 3 milligram-atoms, preferably  $5 \times 10^{-3}$  to 2 milligram-atoms, more preferably  $1 \times 10^{-2}$  to 1 milligram-atom, as the transition metal atom, per gram of the inorganic carrier treated with the organometallic compound.

The catalyst component (A) contains the transition metal compound in an amount of usually 0.005 millimole to 5 millimoles, preferably 0.01 millimole to 1 millimole, especially preferably 0.03 millimole to 0.3 millimole, per gram of the inorganic carrier treated with the halogen-containing silicon compound.

The catalyst component (B) is an aluminoxane.  
15 The aluminoxane used as the catalyst component is, for example, an organoaluminum compound of the following formula (II)

20 wherein R is a hydrocarbon group, X is a halogen atom, and a and b, independently from each other, represent a number of 0 to 80 with the proviso that a and b are not simultaneously zero (in this formula, the degree of polymerization is  $a+b+2$ ),

25 or the following formula (III)

wherein R, X, a and b are as defined hereinabove with regard to formula (II) (in this

In formulae (II) and (III), R represents a hydrocarbon group such as an alkyl, cycloalkyl, aryl or aralkyl group. Preferred as the alkyl group are lower alkyl groups such as a methyl, ethyl, propyl or butyl group. Cyclopentyl and cyclohexyl groups are preferred examples of the cycloalkyl group. Preferred aryl groups are, for example, phenyl and tolyl groups. Preferably, the aralkyl group is, for example, a benzyl or neophyle group. Of these, the alkyl groups are especially preferred.

a and b, independently from each other, are  
15 numbers of 0 to 80, with the proviso that a and b are not  
simultaneously zero.

$$\begin{array}{c} \text{R} \quad \text{R} \\ \diagdown \quad \diagup \\ \text{Al} - \text{O} - \text{Al} - \text{O} - \text{Al} \\ \diagup \quad \diagdown \quad | \quad \diagup \quad \diagdown \\ \text{R} \quad \text{R} \quad \text{R} \quad \text{R} \end{array} \quad (\text{II})-1$$
$$\begin{array}{c} \boxed{\text{O-Al}} \\ | \\ \text{R} \end{array} \quad \text{a} \quad \text{(III)-1}$$

In formula (II)-1, a is preferably 2 to 50, more preferably 4 to 30. Furthermore, in formula (III)-1, a is preferably 4 to 52, more preferably 6 to 32.

a is preferably 0 to 40, more preferably 3 to 30, and b is preferably 1 to 40, more preferably 3 to 30.

The value of  $a+b$  is preferably 4 to 50, more preferably 8 to 30.

- 22 -

In formulae (II) and (III), the two units  
 $\begin{array}{c} \text{-O-Al-} \\ | \\ \text{R} \end{array}$  and  $\begin{array}{c} \text{-O-Al-} \\ | \\ \text{R} \end{array}$  may be bonded in blocks or at random.

When a is 0 in formulae (II) and (III), it is  
 desirable to use an organoaluminum compound of the fol-  
 5 lowing formula (V)

wherein  $\text{R}^7$  is an alkyl group having 1 to 10  
 carbon atoms or a cycloalkyl group having 3 to  
 12 carbon atoms,  $\text{Z}$  is a halogen atom, and  $f$  is  
 10 a number of 1 to 3,

together with the halogenated aluminosane. Examples of  
 such an organoaluminum compound include trimethyl-  
 aluminum, triethylaluminum, tributylaluminum trihexyl-  
 aluminum, diethylaluminum chloride and ethylaluminum  
 15 sesquichloride.

Preferably, the halogenated aluminosane and the  
 organoaluminum compound are used at this time such that  
 the amount of the organoaluminum compound is 0.1 to 10  
 moles, preferably 0.3 to 3.0 moles, especially preferably  
 20 0.5 to 2.0 mole, per mole of Al atom in the halogenated  
 aluminosane.

The aluminosane or the halogenated aluminosane  
 described above can be produced, for example, by the  
 following methods.

25 (1) A method which comprises suspending a  
 compound containing water of adsorption or a salt con-  
 taining water of crystallization, such as magnesium  
 chloride hydrate, nickel sulfate hydrate or cerous  
 chloride hydrate in a medium such as benzene, toluene,  
 30 ethyl ether or tetrahydrofuran, and reacting it with a  
 trialkylaluminum and/or a dialkylaluminum monohalide.

(2) A method which comprises reacting a  
 trialkylaluminum and/or a dialkylaluminum monohalide

- 23 -

directly with water in a medium such as benzene, toluene, ethyl ether or tetrahydrofuran.

It is preferred to adopt the method (1).

Incidentally, the aluminoxane may contain a small amount  
5 of an organometallic compound.

Then catalyst component (C) is an organo-  
aluminum compound having a hydrocarbon group other than  
n-alkyl groups. Such a hydrocarbon group may be, for  
example, an alkyl group having a branched chain such as  
10 an iso-alkyl group, a cycloalkyl group and an aryl group.  
Examples of the above organoaluminum compound are tri-  
alkylaluminums such as triisopropylaluminum, triiso-  
butylaluminum, tri-2-methylbutylaluminum, tri-3-  
methylbutylaluminum, tri-2-methylpentylaluminum, tri-3-  
15 methylpentylaluminum, tri-4-methylpentylaluminum, tri-  
2-methylhexylaluminum, tri-3-methylhexylaluminum and  
tri-2-ethylhexylaluminum; tricycloalkylaluminums such as  
tricyclohexylaluminum; triarylaluminums such as tri-  
phenylaluminum and tritolylaluminum; dialkylaluminum  
20 hydrides such as diisobutylaluminum hydride; and alkyl-  
aluminum alkoxides such as isobutylaluminum methoxide,  
isobutylaluminum ethoxide and isobutylaluminum iso-  
propoxide. Of these organoaluminum compounds, organo-  
aluminum compounds having a branched alkyl group are  
25 preferred, and the trialkylaluminums are especially  
preferred. Furthermore, isoprenylaluminums having the  
general formula  $(i-C_4C_9)_x Al_y (C_5H_{10})_z$  wherein x, y and z  
are positive numbers and  $z \geq 2x$  are also preferably used.  
There can also be used compounds which will yield the  
30 above organoaluminum compounds in the polymerization  
system, for example a combination of an aluminum halide  
and an alkyl lithium or a combination of an aluminum  
halide and an alkylmagnesium, may also be used.

In the process of this invention, the poly-  
35 merization of olefins may be carried out by a liquid-  
phase polymerization method (e.g., slurry polymerization

- 24 -

or solution polymerization) or a gas-phase polymerization method. Prior to the olefin polymerization, prepolymerization may be carried out using a small amount of an olefin.

5           The prepolymerization is carried out (1) in the absence of solvent, or (2) in an inert hydrocarbon medium. Of these, the method (1) is preferred. Desirably, at this time, the catalyst components (A) and (B) are mixed in an inert hydrocarbon medium, and the solvent  
10 is removed by using an evaporator at room temperature or an elevated temperature under atmospheric or reduced pressure. The mole ratio of the transition metal atom in catalyst component (A) to the aluminum atom in catalyst component (B) in the prepolymerization treatment (Al/the  
15 transition metal atom) is from 20 to 5000, preferably from 25 to 2000, more preferably from 30 to 1000. The prepolymerization temperature is from  $-20^{\circ}\text{C}$  to  $70^{\circ}\text{C}$ , preferably  $-10^{\circ}\text{C}$  to  $60^{\circ}\text{C}$ , more preferably  $0^{\circ}\text{C}$  to  $50^{\circ}\text{C}$ .

20           The treatment may be carried out either batch-wise or continuously under reduced, atmospheric or elevated pressure. The prepolymerization may be carried out in the presence of a molecular weight controlling agent such as hydrogen, but it is preferred to limit its  
25 amount at least to one sufficient to produce a prepolymer having an intrinsic viscosity  $[\eta]$ , measured in decalin at  $135^{\circ}\text{C}$ , of at least 0.2 dl/g, preferably 0.5 to 20 dl/g.

          The amount of the transition metal compound (A) at the time of performing the process of this invention  
30 by the slurry polymerization technique or the gas-phase polymerization technique is, in terms of the concentration of the transition metal atom in the polymerization reaction system,  $10^{-8}$  to  $10^{-2}$  gram-atom/liter, preferably  $10^{-7}$  to  $10^{-3}$  gram-atom/liter.

35           In the process of this invention, the amount of the aluminosilane (B), calculated as the aluminum atom in

- 25 -

the reaction system, is not more than 3 milligram-atoms/liter, preferably 0.1 to 2.5 milligram-atoms/liter, especially preferably 0.2 to 2 milligram-atoms/liter. The proportion of the aluminum atoms of the aluminoxane component (B) based on the total amount of the aluminum atoms in the aluminoxane component (B) and the organo-aluminum compound component (C) is usually 20 to 80 %, preferably 25 to 75 mole %, and especially preferably 30 to 70 %. Corresponding to this amount, the proportion of the aluminum atom in the organoaluminum compound component (C) is usually 20 to 80 %, preferably 25 to 75 %, especially preferably 30 to 70 %. In the process of this invention, the ratio of the total amount of aluminum atoms in the aluminoxane component (B) and the organo-aluminum compound component (C) to the transition metal atom in the reaction system is usually from 20 to 10000, preferably from 50 to 5000, especially preferably from 100 to 2000.

According to the above catalyst in accordance with this invention, olefins can be polymerized or copolymerized advantageously.

Investigations of the present inventors have shown that when a compound of a transition metal of group IV of the periodic table and containing a ligand having a conjugated  $\pi$ -electron and a ligand containing hetero atom capable of being bonded to the transition metal and selected from the group consisting of oxygen, sulfur, nitrogen and phosphorus is used as the transition metal compound in the catalyst system, the resulting compound shows the same excellent activity as the catalyst system composed of the components (A), (B) and (C) even if it is not supported on the inorganic carrier.

Accordingly, the present invention secondly provides a process for producing olefins, which comprises polymerizing or copolymerizing the olefins in the presence of a catalyst composed of

- 26 -

(A)' a compound of a transition metal of Group IV of the periodic table containing a ligand having a conjugated  $\pi$ -electron and a ligand containing a hetero atom capable of being bonded to the transition metal and selected from the group consisting of oxygen, sulfur, nitrogen and phosphorus,

(B) an aluminoxane, and

(c) an organoaluminum compound having a hydrocarbon group other than n-alkyl groups.

For example, the transition metal compound (A)' may preferably be a compound of the following formula (I)'

wherein  $R^{11}$  is cycloalkadienyl,  $R^{12}$  is selected from the class consisting of  $-OR^a$ ,  $-SR^b$ ,  $-NR_2^c$  and  $-PR_2^d$ ,  $R^{13}$  and  $R^{14}$ , independently from each other, represent cycloalkadienyl, aryl, aralkyl, halogen or hydrogen,  $R^a$ ,  $R^b$  and  $R^c$  represent alkyl, cycloalkyl, aryl, aralkyl or organic silyl, Me is zirconium, titanium, or hafnium, k and  $\ell$  are 1, 2 or 3, m and n are 0, 1 or 2 and  $k+\ell+m+n=4$ .

Examples of the compounds of formula (I)' include zirconium compounds such as

bis(cyclopentadienyl)methoxyzirconium chloride, bis(cyclopentadienyl)ethoxyzirconium chloride, bis(cyclopentadienyl)butoxyzirconium chloride, bis(cyclopentadienyl)2-ethylhexoxyzirconium chloride,

bis(cyclopentadienyl)methylzirconium ethoxide, bis(cyclopentadienyl)methylzirconium butoxide, bis(cyclopentadienyl)ethylzirconium ethoxide, bis(cyclopentadienyl)phenylzirconium ethoxide, bis(cyclopentadienyl)benzylzirconium ethoxide, bis(methylcyclopentadienyl)ethoxyzirconium

chloride,

- 27 -

bis(indenyl)ethoxyzirconium chloride,  
bis(cyclopentadienyl)ethoxyzirconium,  
bis(cyclopentadienyl)butoxyzirconium,  
bis(cyclopentadienyl)2-ethylhexoxyzirconium,  
5 bis(cyclopentadienyl)phenoxyzirconium chloride,  
bis(cyclopentadienyl)cyclohexoxyzirconium  
chloride,  
bis(cyclopentadienyl)phenylmethoxyzirconium  
chloride,  
10 bis(cyclopentadienyl)methylzirconium phenyl-  
methoxide,  
bis(cyclopentadienyl)trimethylsiloxyzirconium  
chloride,  
bis(cyclopentadienyl)triphenylsiloxyzirconium  
15 chloride,  
bis(cyclopentadienyl)thiophenylzirconium  
chloride,  
bis(cyclopentadienyl)bis(dimethylamide)-  
zirconium,  
20 bis(cyclopentadienyl)diethylamidezirconium  
chloride,  
ethylenebis(indenyl)ethoxyzirconium chloride,  
and  
ethylenebis(4,5,6,7-tetrahydro-1-indenyl)-  
25 ethoxyzirconium chloride;  
titanium compounds such as  
bis(cyclopentadienyl)ethoxytitanium chloride,  
bis(cyclopentadienyl)butoxytitanium chloride,  
bis(cyclopentadienyl)methyltitanium ethoxide,  
30 bis(cyclopentadienyl)phenoxytitanium chloride,  
bis(cyclopentadienyl)trimethylsiloxytitanium  
chloride,  
bis(cyclopentadienyl)thiophenyltitanium  
chloride,  
35 bis(cyclopentadienyl)bis(dimethylamide)titanium  
and

- 28 -

bis(cyclopentadienyl)ethoxytitanium; and  
hafnium compounds such as

bis(cyclopentadienyl)ethoxyhafnium chloride,  
bis(cyclopentadienyl)butoxyhafnium chloride,  
5 bis(cyclopentadienyl)methylhafnium ethoxide,  
bis(cyclopentadienyl)phenoxyhafnium chloride,  
bis(cyclopentadienyl)thiophenylhafnium  
chloride, and

bis(cyclopentadienyl)bis(diethylamide)hafnium.  
10 It should be understood that in the process of  
this invention using the above catalyst system composed  
of the catalyst components (A)', (B) and (C), the pre-  
ferred concentrations and proportions of these catalyst  
components (A)', (B) and (C) are the same as described  
15 hereinabove with the aforesaid catalyst system.

Investigations of the present inventors have  
also shown that by limiting the amount of the aluminoxane  
used to not more than 3 milligram-atoms/liter as Al atom  
in the catalyst system composed of the components (A),  
20 (B) and (C) and the catalyst system composed of (A)', (B)  
and (C), excellent catalytic activity can be exhibited.

On the basis of this fact, it has been found  
that when the amount of the aluminoxane used is limited  
to not more than 3 milligram-atoms/liter as Al atom in  
25 the reaction system, the use of any of the compounds of  
formula (I) as the group IVB transition metal compounds  
without being supported on the inorganic carrier can  
exhibit the same excellent activity.

Accordingly, the present invention thirdly  
30 provides a process for polymerizing or copolymerizing  
olefins in the presence of a catalyst composed of

(A)" a compound of a transition metal of Group  
IVB of the periodic table,

(B) an aluminoxane in a concentration of not  
35 more than 3 milligrams/liter as aluminum atom in the  
reaction system, and

- 29 -

(C) an organoaluminum compounds having a hydrocarbon group other than n-alkyl groups.

The same compounds as represented by formula (I) can be used as the transition metal compound (A)".

5 The aluminoxane (B) and the organoaluminum compound (C) may be the same as described above.

In the process of this invention, the catalyst components (A)", (B) and (C) may be separately fed into the reaction system. Or it is possible to add a pre-  
10 mixture of any two of the above compounds and the remaining one catalyst component separately into the reaction system. Alternatively, all the catalyst components may be pre-mixed and then fed into the reaction system. When two catalyst components are to be mixed in  
15 advance, the catalyst components to be mixed are preferably the catalyst components (A) and (B).

In the premixing of the catalyst components (A) and (B), the concentration of the transition metal atom is usually  $2.5 \times 10^{-4}$  to  $1.5 \times 10^{-1}$  gram-atom/liter, preferably  $5.0 \times 10^{-4}$  to  $1.0 \times 10^{-1}$  gram-atom/liter. The  
20 concentration of the aluminoxane is usually 0.05 to 5 gram-atoms/liter, preferably 0.1 to 3 gram-atoms/liter, as Al atom. The temperature in the premixing is usually  $-50^{\circ}\text{C}$  to  $100^{\circ}\text{C}$ , and the mixing time is usually 0.1  
25 minute to 50 hours.

It should be understood that the preferred concentrations and mixing ratios of the components (A)", (B) and (C) in the polymerization system are the same as in the above catalyst system.

30 All the catalysts described above can be used advantageously in the homopolymerization or copolymerization of olefins. They are especially effective for the production of an ethylene polymer and ethylene/alpha-olefin copolymers. Examples of the olefins that can be  
35 utilized are ethylene and alpha-olefins having 3 to 20 carbon atoms, such as propylene, 1-butene, 1-hexene,

- 30 -

4-methyl-1-pentene, 1-octene, 1-decene, 1-dodecene, 1-tetradecene, 1-hexadecene, 1-octadecene and 1-eicocene.

The polymerization of olefins by the process of this invention is usually carried out in a gas-phase or in a liquid phase, for example in slurry. In the slurry polymerization, an inert hydrocarbon may be used as a solvent. It is also possible to use an olefin itself as the solvent.

Specific examples of the hydrocarbon solvent are aliphatic hydrocarbons such as butane, isobutane, pentane, hexane, octane, decane, dodecane, hexadecane and octadecane; alicyclic hydrocarbons such as cyclopentane, methylcyclopentane, cyclohexane and cyclooctane, aromatic hydrocarbons such as benzene, toluene and xylene, and petroleum fractions such as gasoline, kerosene and light oil. Of these hydrocarbon media, the aliphatic hydrocarbons, alicyclic hydrocarbons and petroleum fractions are preferred.

When slurry polymerization is carried out in the process of this invention, the polymerization temperature is usually  $-50$  to  $120^{\circ}\text{C}$ , preferably  $0$  to  $100^{\circ}\text{C}$ .

When slurry polymerization or gas-phase polymerization is carried out by the process of this invention, the proportion of the transition metal compound is usually  $10^{-8}$  to  $10^{-2}$  gram-atom/liter, preferably  $10^{-7}$  to  $10^{-3}$  gram-atom/liter as the transition metal atom in the polymerization system.

In the present polymerization reaction, the aluminosilicate may, or may not, be used additionally. To obtain a polymer having excellent powder properties, it is preferred not to use the aluminosilicate additionally.

The polymerization pressure is usually atmospheric pressure to  $100\text{ kg/cm}^2$ , preferably  $2$  to  $50\text{ kg/cm}^2$ . The polymerization may be carried out batchwise, semi-continuously or continuously.

- 31 -

The polymerization may be carried out in two or more stages having different reaction conditions.

When the slurry polymerization method or the gas-phase polymerization method is used to polymerize olefins, particularly polymeric ethylene or ethylene with an alpha-olefin in this invention, there is no polymer adhesion to the reactor and the resulting polymer has excellent powder properties and a narrow molecular weight distribution. When the invention is applied to the copolymerization of at least two olefins, an olefin copolymer having a narrow molecular weight distribution and a narrow composition distribution can be obtained.

[EXAMPLES]

The process of this invention will now be specifically illustrated by the following examples. The  $\bar{M}_w/\bar{M}_n$  value was measured by the following procedure in accordance with Takeuchi, "Gel Permeation Chromatography", published by Maruzen Co., Ltd.

(1) By using standard polystyrene of a known molecular weight (monodisperse polystyrene produced by Toyo Soda Co., Ltd.), the molecular weight  $M$  and its GPC (gel permeation chromatograph) count are measured. A calibration curve of the molecular weight  $M$  versus  $EV$  (elution volume) is prepared. The concentration at this time is adjusted to 0.02 % by weight.

(2) The GPC chromatogram of the sample is taken by GPC, and the number average molecular weight  $\bar{M}_n$  and the weight average molecular weight  $\bar{M}_w$  of the sample are calculated as polyethylene by the procedure (1) above, and the  $\bar{M}_w/\bar{M}_n$  value is determined. The sample preparation conditions and the GPC measurement conditions at this time are as follows:-

Sample preparation:

(a) Take the sample together with o-dichlorobenzene solvent in an Erlenmeyer flask so that its concentration is 0.1 % by weight.

- 32 -

(b) Heat the flask to 140 °C and stir the contents for about 30 minutes to dissolve the sample.

(c) Subject the filtrate from it to GPC.

GPC measurement conditions:

5 (a) Device: 150C-ALC/GPC made by Waters Co.  
 (b) Column: GMH type made by Toyo Soda Co., Ltd.

(c) Amount of the sample: 400 microliters

(d) Temperature: 140 °C

10 (e) Flow rate: 1 ml/min.

The amount of an n-decane-soluble portion in the copolymer (as the amount of the soluble portion is smaller, the narrower is the composition distribution) was measured by adding about 3 g of the copolymer to 450 ml of n-decane, dissolving the copolymer at 145 °C, cooling the solution to 23 °C, removing the n-decane-insoluble portion by filtration, and recovering the n-decane-soluble portion from the filtrate.

20 The B value of the ethylenic copolymer of this invention is defined as follows:

$$B = \frac{P_{OE}}{2P_O \cdot P_E}$$

25 wherein  $P_E$  represents the molar fraction of the ethylene component in the copolymer,  $P_O$  represents the molar fraction of the alpha-olefin component, and  $P_{OE}$  represents the molar fraction of the alpha-olefin/ethylene sequence in the total dyad sequence.

The B value is an index showing the state of distribution of the individual monomer components in the copolymer and is calculated by determining  $P_E$ ,  $P_O$  and  $P_{OE}$  in the above definition in accordance with the papers of G. J. Ray [Macromolecules, 10, 773 (1977)], J. C. Randall [Macromolecules, 15, 353 (1982), J. Polymer Science, Polymer Physics Ed., 11, 275 (1973)], and K. Kimura

- 33 -

[Polymer, 25, 441 (1984)]. As the B value is larger, the amount of block-like sequences is smaller and the distribution of ethylene and the alpha-olefin is more uniform. Thus, the copolymer has a narrower composition  
5 distribution.

The composition distribution B value is determined as follows: About 200 mg of the copolymer is uniformly dissolved in 1 ml of hexachlorobutadiene in a sample tube having a diameter of 10 mm, and a  $^{13}\text{C}$ -NMR  
10 spectrum of the sample is taken usually at a temperature of 120 °C under the following conditions.

Measuring frequency: 25.05 MHz

Spectral width: 1500 Hz

Filter width: 1500 Hz

15 Pulse repeating time: 4.2 sec

Pulse width: 7 microseconds

Number of integrations: 2000 to 5000

From the spectrum,  $P_E$ ,  $P_O$  and  $P_{OE}$  are determined, and the B value is calculated from them.

#### 20 EXAMPLE 1

##### Preparation of aluminoxane

A 400 ml flask purged fully with nitrogen was charged with 37 g of  $\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}$  and 125 ml of toluene. The flask was cooled to 0 °C, and 500 milli-  
25 moles of trimethyl aluminum diluted with 125 ml of toluene was added dropwise. The mixture was heated to 40 °C, and the reaction was continued at this temperature for 10 hours. After the reaction, the reaction mixture was subjected to solid-liquid separation by filtration.  
30 Toluene was removed from the filtrate to give 13 g of aluminoxane as a white solid. It has a molecular weight, determined by freezing point depression in benzene, of 930. Its m value in the catalyst component [B] was 14.

##### Polymerization

35 Toluene (500 ml) was introduced into a 1-liter glass autoclave fully purged with nitrogen, and a gaseous

- 34 -

mixture of ethylene and propylene (120 liters/hr, and 80 liters/hr, respectively) was passed through the flask and left to stand at 20 °C for 10 minutes. Then, 0.5 millimole of triisobutyl aluminum was added. Five minutes later, 0.25 milligram-atom, as aluminum atom, of the aluminoxane and subsequently  $2.5 \times 10^{-3}$  millimole of bis(cyclopentadienyl)zirconium dichloride were added, and the polymerization was started. The gaseous mixture of ethylene and propylene was continuously fed, and polymerized at 20 °C under atmospheric pressure for 1 hour. After the polymerization, a small amount of methanol was added to stop the polymerization. The polymer solution was poured into a large excess of methanol to precipitate the polymer. The precipitated polymer was dried at 130 °C under reduced pressure for 12 hours. There was consequently obtained 19.1 g of a polymer having an MFR of 0.31 g/min., an ethylene content, measured by  $^{13}\text{C}$ -NMR, of 84.1 mole %, an  $\bar{M}_w/\bar{M}_n$  of 2.39 and a B value of 1.13.

## COMPARATIVE EXAMPLE 1

Example 1 was repeated except that in the polymerization of Example 1, triisobutyl aluminum was not used. Hardly any polymer was obtained.

## EXAMPLES 2-9 AND COMPARATIVE EXAMPLES 2-6

Polymerization was carried out under the conditions described in Table 1 by the same operation as in Example 1. The results are shown in Table 2.

## EXAMPLE 10

Polymerization

A 2-liter stainless steel autoclave fully purged with nitrogen was charged with 250 ml of hexane and 750 ml of 4-methyl-1-pentene, and heated to 35 °C. Then, 0.25 millimole of triisobutyl aluminum, 0.5 milligram-atom, calculated as aluminum atom, of the aluminoxane synthesized in Example 1, and  $1 \times 10^{-3}$  millimole of bis(cyclopentadienyl)zirconium dichloride were introduced into the autoclave. Ethylene was subsequently introduced

- 35 -

and the polymerization was started. Ethylene was continuously fed so as to maintain the total pressure at 8 kg/cm<sup>2</sup>-G; and polymerized at 45 °C for 1 hour. The subsequent operation was carried out in the same way as  
5 in Example 1 to give 33.1 g of a polymer having an MFR of 0.55 g/10 min., a density of 0.901 g/cm<sup>3</sup>, an  $\bar{M}_w/\bar{M}_n$  of 2.92 and a decane-soluble weight fraction at room temperature of 1.8 % by weight.

## EXAMPLES 11-13 AND COMPARATIVE EXAMPLE 7

10 Polymerization was carried out under the conditions described in Table 3 by the same operation as in Example 10. The results are shown in Table 4.

## EXAMPLE 14

A 1-liter continuous polymerization reactor was continuously fed with 500 ml/hr of toluene, 0.5 milligram-atom/hr, calculated as aluminum atom, of the aluminoxane synthesized in Example 1, and  $5 \times 10^{-3}$  millimole/hr of bis(cyclopentadienyl)zirconium dichloride, and simultaneously, 150 liters/hr of ethylene, 100 liters/hr of propylene and 1.2 g/hr of 5-ethylidene-2-norbornene (ENB) were continuously fed into the reactor, and polymerized at 20 °C under atmospheric pressure with a residence time of 1 hour and a polymer concentration of 15 g/liter. The resulting polymerization product was worked up as in Example 1 to give an ethylene/propylene/ENB copolymer having an MFR of 2.25 g/10 min., an ethylene content, measured by <sup>13</sup>C-NMR, of 86.9 mole %, an  $\bar{M}_w/\bar{M}_n$  of 2.45, and an iodine value of 11.

## COMPARATIVE EXAMPLE 8

Example 1 was repeated except that in the polymerization of Example 1, triisobutyl aluminum was not used, the amount of the aluminoxane was changed to

- 42 -

2.5 milligram-atoms calculated as aluminum atom, and the polymerization was carried out for 30 minutes. There was obtained 22.8 g of a polymer having an MFR of 1.63 g/10 min., an ethylene content of 82.8 mole %, an  $\bar{M}_w/\bar{M}_n$  of 1.92 and a B value of 1.14.

## EXAMPLE 15

Pre-mixing of the catalyst components [A] and [B]

To a 100 ml glass flask fully purged with nitrogen, 4.7 ml of a toluene solution (Al 0.85 mole/liter) of the aluminoxane synthesized in Example 1, 2.4 ml of a toluene solution (Zr 0.01 mole/liter) of bis(cyclopentadienyl)zirconium dichloride and 12.9 ml of toluene were added, and stirred at 22 °C for 1 hour to give a yellow transparent solution.

Polymerization

A 2-liter stainless steel autoclave fully purged with nitrogen was charged with 500 ml of hexane, 500 ml of 4-methyl-1-pentene and 0.5 millimole of triisobutyl aluminum, and heated to 47 °C. Thereafter, 2.5 ml of the solution prepared as above was forced into the autoclave under ethylene pressure, and the polymerization was started. Ethylene was continuously fed so as to maintain the total pressure at 7 kg/cm<sup>2</sup>-G, and the polymerization was carried out at 50 °C for 1 hour. There was obtained 71.4 g of a polymer having an MFR of 1.08 g/10 min., a density of 0.902 g/cm<sup>3</sup>, an  $\bar{M}_w/\bar{M}_n$  of 2.90 and a decane-soluble portion weight fraction at room temperature of 1.5 % by weight.

## EXAMPLE 16

Pre-mixing of catalyst components [A] and [B]

The procedure described in Example 15 was repeated except that 4.8 ml of a toluene solution (Zr 0.01 mole/liter) of bis(cyclopentadienyl)zirconium dichloride and 10.5 ml of toluene were used.

Polymerization

Example 15 was repeated except that 1.25 ml of the solution prepared above was used. There was obtained

- 43 -

46.1 g of a polymer having an MFR of 0.82 g/min., a density of 0.904 g/cm<sup>3</sup>, an  $\bar{M}_w/\bar{M}_n$  of 2.86 and a decane-soluble portion weight fraction at room temperature of 1.3 % by weight.

5

## EXAMPLE 17

Pre-mixing of catalyst components [A] and [B]

In Example 15, 12.0 ml of a toluene solution (Zr 0.04 mole/liter) of bis(cyclopentadienyl)zirconium dichloride, 6.3 ml of a toluene solution (Al 2.55 moles/liter) of the aluminoxane synthesized in Example 1 and 1.7 ml of toluene were stirred at 22 °C for 30 minutes to give a deep yellow transparent solution.

Polymerization

Example 15 was repeated except that 0.125 ml of the solution prepared above and 1.0 millimole of triisobutyl aluminum were used and the polymerization was carried out at 60 °C for 1 hour. There was obtained 38.5 g of a polymer having an MFR of 1.09 g/10 min., a density of 0.902 g/cm<sup>3</sup>, an  $\bar{M}_w/\bar{M}_n$  of 2.82 and a decane-soluble portion weight fraction at room temperature of 1.3 % by weight.

## EXAMPLE 18

Polymerization

A 2-liter stainless steel autoclave fully purged with nitrogen was charged with 500 ml of toluene, 1 milligram-atom, calculated as aluminum atom, of the aluminoxane synthesized in Example 1, and 2 millimoles of triisobutyl aluminum.

Furthermore, propylene was introduced at 5 kg/cm<sup>2</sup>-G at 30 °C. Thereafter, the introduction of propylene was stopped, and the mixture was cooled to -10 °C. Then, 1 x 10<sup>-3</sup> millimole of ethylenebis(indenyl)zirconium dichloride was introduced into the autoclave, and the polymerization was started. By performing the polymerization at -10 °C for 6 hours, 44.2 g of a polymer was obtained.

- 44 -

## COMPARATIVE EXAMPE 9

Example 18 was repeated except that in the polymerization of Example 18, triisobutyl aluminum was not used. There was obtained 2.4 g of a polymer.

## EXAMPLE 19

5

Preparation of aluminoxane

A 400 ml flask fully purged with nitrogen was charged with 37 g of  $\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}$  and 125 ml of toluene, and cooled to 0 °C. Then, 500 millimoles of trimethyl aluminum diluted with 125 ml of toluene was added dropwise. The temperature was then elevated to 40 °C, and the reaction was continued at this temperature for 10 hours. After the reaction, the reaction mixture was subjected to solid-liquid separation by filtration. Toluene was removed from the filtrate to obtain 13 g of aluminoxane as a white solid. It had a molecular weight, determined by freezing point depression in benzene, of 930. It shows an m value of 14 in catalyst component [B].

20 Preparation of a zirconium catalyst

A 200 ml flask fully purged with nitrogen was charged with 3.8 g of calcined silica obtained by calcining silica (average particle diameter 70 microns, specific surface area 260 m<sup>2</sup>/g, pore volume 1.65 cm<sup>3</sup>/g) at 300 °C for 4 hours, and, 51.5 ml of a toluene solution (Al 0.49 mole/liter) of aluminoxane, and they were stirred at room temperature for 10 minutes. Then, toluene was removed by an evaporator at room temperature to give a solid product. To the solid product was added 7.9 ml of a toluene solution (Zr 0.04 millimole/liter) of bis(cyclopentadienyl)zirconium dichloride, and again toluene was removed by an evaporator at room temperature to give a catalyst component having a Zr content of 0.54 % by weight. A gaseous mixture of ethylene and nitrogen (30 liters/hr and 45 liters/hr, respectively) was passed through the resulting catalyst component at

- 45 -

room temperature for 30 minutes to obtain a solid catalyst component in which ethylene was polymerized in an amount of 0.86 g per gram of the catalyst.

#### Polymerization

5           A 2-liter stainless steel autoclave fully  
purged with nitrogen was charged with 900 ml of hexane  
and 100 ml of 1-hexane, and heated to 45 °C. Then, 1  
millimole of triisobutyl aluminum and 0.015 milligram-  
atom, calculated as zirconium atom, of the zirconium  
10 catalyst subjected to prepolymerization with ethylene  
were charged. The temperature was then elevated to  
60 °C. Subsequently, ethylene was introduced and the  
polymerization was started. Ethylene was continuously  
fed so as to maintain the total pressure at 7 kg/cm<sup>2</sup>-G,  
15 and the polymerization was carried out at 70 °C for 2  
hours. After the polymerization, the polymer slurry was  
added to a large excess of methanol, and the mixture was  
filtered. The resulting polymer was dried at 80 °C for  
12 hours under reduced pressure to give 101.2 g of a  
20 polymer having an MFR of 0.16 g/10 min., a density of  
0.916 g/cm<sup>3</sup>, an  $\bar{M}_w/\bar{M}_n$  of 2.98, a bulk density of 0.33  
g/cm<sup>3</sup> and an n-decane soluble weight fraction at room  
temperature of 0.31 % by weight. The polymerization  
conditions, etc. are shown in Table 5.

25

#### EXAMPLE 20

Example 19 was repeated except that the amount  
of ethylene prepolymerized was changed to 0.66 g per gram  
of the catalyst.

#### Polymerization

30

Example 19 was repeated except that 1-hexane  
was not used, 1000 ml of hexane was used as a solvent,  
and ethylene was homopolymerized under a total pressure  
of 6 kg/cm<sup>2</sup>-G. The results are shown in Table 6.

#### COMPARATIVE EXAMPLE 10

35

#### Polymerization

Example 20 was repeated except that isobutyl

- 46 -

aluminum was not used. The results are shown in Table 6.

## EXAMPLE 21

Polymerization

A 2-liter stainless steel autoclave purged fully  
5 with nitrogen was charged with 250 g of sodium chloride  
(special reagent grade, Wako Pure Chemicals, Co., Ltd.),  
and dried under reduced pressure at 90 °C for 1 hour.  
Then, the autoclave was cooled to 65 °C, and the inside  
of the autoclave was replaced by ethylene. Subsequently,  
10 1 millimole of triisobutyl aluminum, 0.015 milligram-atom,  
calculated as zirconium atom, of the zirconium catalyst  
prepared in Example 19, and 10 ml of 1-hexene were  
introduced. Furthermore, ethylene was introduced, and  
the total pressure was adjusted to 8 kg/cm<sup>2</sup>-G. The  
15 polymerization was started. Thereafter, only ethylene  
was supplied, and the polymerization was carried out at  
70 °C for 2 hours while maintaining the total pressure at  
8 kg/cm<sup>2</sup>-G. After the polymerization, the reaction  
mixture was washed with water to remove sodium chloride.  
20 The remaining polymer was washed with methanol, and dried  
overnight at 80 °C under reduced pressure. The polymer  
was yielded in an amount of 46.8 g, and had an MFR of  
1.45 g/10 min., a density of 0.925 g/cm<sup>3</sup>, an  $\bar{M}_w/\bar{M}_n$  of  
3.03, a bulk density of 0.31 g/cm<sup>3</sup> and an n-decane-  
25 soluble portion weight fraction of 0.10 % by weight.

## EXAMPLE 22

Example 21 was repeated except that in the  
polymerization of Example 21, 1-hexene was not used,  
triisobutyl aluminum and the zirconium catalyst were  
30 added at 75 °C, and the polymerization was carried out at  
80 °C for 1 hour. The results are shown in Table 6.

## EXAMPLES 23-26

Polymerization was carried out under the con-  
ditions indicated in Table 5 in the same way as in  
35 Example 19. The results are shown in Table 6.

- 47 -

## EXAMPLE 27

Preparation of a zirconium catalyst

A 200 ml flask purged fully with nitrogen was charged with 5.8 g of calcined alumina obtained by calcining alumina (average particle diameter 60 microns, specific surface area  $290 \text{ m}^2/\text{g}$ , pore volume  $1.05 \text{ ml/g}$ ) at  $500^\circ\text{C}$  for 5 hours, 17 ml of a toluene solution (Al 1 mole/liter) of dimethylaluminum monochloride, and 50 ml of toluene, and they were heated at  $80^\circ\text{C}$  for 2 hours.

The reaction mixture was then subjected to solid-liquid separation by filtration. The solid portion was transferred to 50 ml of toluene, and 32 ml of a toluene solution (Zr 0.04 mole/liter) of bis(cyclopentadienyl)-zirconium dichloride was added. The mixture was heated at  $80^\circ\text{C}$  for 1 hour. Again, the mixture was subjected to solid-liquid separation by filtration to give a solid catalyst. The zirconium content of the solid catalyst was 0.27 % by weight. 0.1 milligram, calculated as zirconium atom, of the solid catalyst, 20 ml of a toluene solution (Al 0.49 mole/liter) of the aluminoxane synthesized in Example 19, and 20 ml of toluene were added to the solid catalyst, and the mixture was stirred at room temperature for 30 minutes. Toluene was then removed by an evaporator at room temperature. A gaseous mixture of ethylene and nitrogen (30 liters/hr and 45 liters/hr, respectively) was passed through the resulting catalyst component at room temperature for 30 minutes to give a solid catalyst component in which ethylene was polymerized in an amount of 0.30 g per gram of the catalyst.

Polymerization

Polymerization was carried out in the same way as in Example 22. The results are shown in Table 6.

## COMPARATIVE EXAMPLE 11

Example 27 was repeated except that triisobutyl aluminum was not used. The results are shown in Table 6.

## EXAMPLE 28

Preparation of aluminoxane

A 400 ml flask fully purged with nitrogen was charged with 37 g of  $\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}$  and 125 ml of toluene, and cooled to 0 °C. 500 millimoles of trimethyl aluminum diluted with 125 ml of toluene was added dropwise. The mixture was heated to 40 °C, and reacted at this temperature for 10 hours. After the reaction, the reaction mixture was subjected to solid-liquid separation by filtration, and toluene was removed from the filtrate to give 13 g of aluminoxane as a white solid. It had a molecular weight, determined by freezing point depression in benzene, of 930. It showed an m value of 14 in catalyst component [B].

- 51 -

Polymerization

A 1-liter glass autoclave fully purged with nitrogen was charged with 500 ml of toluene, and a gaseous mixture of ethylene and propylene (120 liters/hr, and 80 liters/hr, respectively) was passed through the autoclave and left to stand for 20 °C for 10 minutes. Thereafter, 0.5 millimole of triisobutyl aluminum was added. Five minutes later, 0.25 milligram-atom, calculated as aluminum atom, of aluminoxane and subsequently,  $2.5 \times 10^{-3}$  millimole of bis(cyclopentadienyl)phenoxy-zirconium monochloride were added, and the polymerization was started. A gaseous mixture of ethylene and propylene was continuously fed, and polymerized at 20 °C under atmospheric pressure for 1 hour. After the polymerization, a small amount of methanol was added to stop the polymerization. The polymer solution was added to a large excess of methanol to precipitate the polymer. The polymer precipitate was dried at 130 °C under reduced pressure for 12 hours. The polymer was yielded in an amount of 10.9 g, and had an MFR of 0.21 g/10 min., an ethylene content, determined by  $^{13}\text{C}$ -NMR, of 85.5 mole %, an  $\bar{M}_w/\bar{M}_n$  of 2.35 and a B value of 1.11. The polymerization conditions are shown in Table 7.

## COMPARATIVE EXAMPLE 12

Example 28 was repeated except that triisobutyl aluminum was not used in the polymerization of Example 28. No polymer was obtained.

## EXAMPLES 29-32

Polymerization was carried out under the conditions shown in Table 7 by the same procedure as in Example 28. The results are shown in Table 7.

## EXAMPLE 33

Preparation of catalyst component (A)

Fifty milliliters of a solution of bis(cyclopentadienyl)ethoxyzirconium monochloride ( $\text{Zr}$  1.35 millimoles/liter) in toluene was introduced into a 200 ml

- 52 -

glass flask fully purged with nitrogen. Furthermore, 34 ml of dimethylaluminum chloride (Al 4 millimoles/liter) was added. The mixture was reacted at 25 °C for 30 minutes to give a catalyst component (A).

5 Polymerization

Example 28 was repeated except that the catalyst component (A) prepared as above was used instead of bis(cyclopentadienyl)phenoxyzirconium monochloride.

COMPARATIVE EXAMPLE 13

10 Example 33 was repeated except that triisobutyl aluminum was not used in the polymerization of Example 33. Hardly any polymer was obtained.

EXAMPLES 34-40

15 Polymerization was carried out under the conditions indicated in Table 7 by the same operation as in Example 28. The results are shown in Table 7.

EXAMPLE 41

Polymerization

20 A 2-liter stainless steel autoclave fully purged with nitrogen was charged with 250 ml of hexane and 750 ml of 4-methyl-1-pentene, and heated to 35 °C. Thereafter, 0.25 millimole of triisobutyl aluminum, 0.5 milligram-atom, calculated as aluminum atom, of the aluminoxane synthesized in Example 1, and  $1 \times 10^{-3}$   
25 milligram-atom, as zirconium atom, of the catalyst component (A) synthesized in Example 6 were introduced. Subsequently, ethylene was introduced, and the polymerization was started. Ethylene was continuously fed so as to maintain the total pressure at 8 kg/cm<sup>2</sup>-G, and the  
30 polymerization was carried out at 45 °C for 1 hour. The polymerization product was worked up as in Example 1 to give 30.5 g of a polymer having an MFR of 0.62 g/10 min., a density of 0.902 g/cm<sup>3</sup>, an  $\bar{M}_w/\bar{M}_n$  of 2.98 and a decane-soluble portion weight fraction at room temperature of  
35 1.9 % by weight.

- 53 -

## EXAMPLE 42

Example 41 was repeated except that in the polymerization of Example 41, 750 ml of 1-hexene was used instead of 4-methyl-1-pentene. There was obtained 28.5 g of a polymer having an MFR of 1.01 g/10 min., a density of 0.891 g/cm<sup>3</sup> and an  $\bar{M}_w/\bar{M}_n$  of 2.79.

## COMPARATIVE EXAMPLE 14

Example 41 was repeated except that in the polymerization of Example 41, triisobutyl aluminum was not used. There was obtained 2.5 g of a polymer having an MFR of 1.94 g/10 min., a density of 0.908 g/cm<sup>3</sup>, an  $\bar{M}_w/\bar{M}_n$  of 2.95 and a decane-soluble portion weight fraction at room temperature of 1.1 % by weight.

## EXAMPLE 43

A 1-liter continuous polymerization reactor was charged continuously with 500 ml/hr of toluene, 0.5 millimole/hr of tributyl aluminum, 0.5 milligram-atom/hr, calculated as aluminum atom, of the aluminoxane synthesized in Example 28, and  $5 \times 10^{-3}$  milligram-atom/hr, calculated as zirconium atom, of the catalyst component (A) synthesized in Example 40. Simultaneously, 150 liters/hr of ethylene, 100 liters/hr of propylene, and 1.2 g/hr of ethylidene-2-norbornene (ENB) were continuously fed into the reactor. The polymerization was carried out at a temperature of 20 °C under atmospheric pressure with a residence time of 1 hour and a polymer concentration of 14 g/liter. The resulting polymerization product was worked up as in Example 28 to give an ethylene/propylene/ENB copolymer having an MFR of 2.04 g/10 min., an ethylene content, determined by <sup>13</sup>C-NMR, of 85.8 mole %, an  $\bar{M}_w/\bar{M}_n$  of 2.49 and an iodine value of 10.

## SCOPE OF CLAIM FOR PATENT

1. A process for polymerizing olefins, which comprises polymerizing or copolymerizing olefins in the presence of a catalyst composed of
  - (A) a solid catalyst component composed of a compound of a transition metal of Group IVB of the periodic table supported on an inorganic carrier,
  - (B) an aluminoxane, and
  - (C) an organoaluminum compound having a hydrocarbon group other than n-alkyl groups.
2. The process set forth in claim 1 wherein the transition metal is titanium, zirconium or hafnium.
3. The process set forth in claim 1 wherein the transition metal compound is represented by the following formula (I)

wherein  $R^1$  represents a cycloalkadienyl group,  $R^2$ ,  $R^3$  and  $R^4$  are identical or different and each represents a cycloalkadienyl group, an aryl group, an alkyl group, a cycloalkyl group, an aralkyl group, a halogen atom, a hydrogen atom, or a group of the formula  $-OR^a$ ,  $-SR^b$  or  $-NR_2^c$  in which each of  $R^a$ ,  $R^b$  and  $R^c$  represents an alkyl group, a cycloalkyl group, an aryl group, an aralkyl group or an organic silyl group, Me represents zirconium, titanium or hafnium, k is 1, 2, 3 or 4, l, m and n are each 0, 1, 2 or 3, and  $k+l+m+n=4$ .

4. The process set forth in claim 1 wherein the aluminoxane is represented by the following formula (II)

wherein R is a hydrocarbon group, X is a halogen atom, and a and b, independently from

- 58 -

each other, represent a number of 0 to 80 with the proviso that a and b are not simultaneously zero,

or the following formula (III)

wherein R, X, a and b are as defined above with regard to formula (II).

5. The process set forth in claim 1 wherein the inorganic carrier is treated with an organometallic compound or a halogen-containing silicon compound prior to deposition of the transition metal compound on it.

6. The process set forth in claim 1 wherein the organometallic compound is an organoaluminum compound, and organoboron compound, an organomagnesium compound, an organozinc compound or an organolithium compound.

7. The process of claim 1 wherein the halogen-containing silicon compound is represented by the following formula (IV)

wherein Y represents a chlorine or bromine atom,  $\text{R}^5$  and  $\text{R}^6$ , independently from each other, represent a hydrogen atom, an alkyl group having 1 to 12 carbon atoms, an aryl group or a cycloalkyl group having 3 to 12 carbon atoms, d is a number of 1 to 4, and e is a number of 0 to 4, with the proviso that the sum of d and e is a number of 1 to 4.

8. The process set forth in claim 1 wherein the inorganic carrier is a porous inorganic oxide.

9. The process set forth in claim 1 wherein the organic group of the organoaluminum compound is a

- 59 -

branched alkyl group, a cycloalkyl group or an aryl group.

10. A process for producing olefins, which comprises polymerizing or copolymerizing the olefins in the presence of a catalyst composed of

(A)' a compound of a transition metal of Group IV of the periodic table containing a ligand having a conjugated  $\pi$ -electron and a ligand containing a hetero atom capable of being bonded to the transition metal and selected from the group consisting of oxygen, sulfur, nitrogen and phosphorus,

(B) an aluminoxane, and

(C) an organoaluminum compound having a hydrocarbon group other than n-alkyl groups.

11. The process set forth in claim 10 wherein the transition metal is titanium, zirconium or hafnium.

12. The process set forth in claim 10 wherein the transition metal compound is represented by the following formula (I)'

wherein  $R^{11}$  is cycloalkadienyl,  $R^{12}$  is selected from the class consisting of  $-OR^a$ ,  $-SR^b$ ,  $-NR_2^c$  and  $-PR_2^d$ ,  $R^{13}$  and  $R^{14}$ , independently from each other, represent cycloalkadienyl, aryl, aralkyl, alkyl, halogen or hydrogen,  $R^a$ ,  $R^b$  and  $R^c$  represent alkyl, cycloalkyl, aryl, aralkyl or organic silyl, Me is zirconium, titanium, or hafnium, k and  $\ell$  are 1, 2 or 3, m and n are 0, 1 or 2 and  $k+\ell+m+n=4$ .

13. The process set forth in claim 10 wherein the aluminoxane is represented by the formula (II) given above.

14. The process set forth in claim 10 wherein the organic group of the organoaluminum compound is a branched alkyl group, a cycloalkyl group or an aryl group.

- 60 -

15. The process of claim 10 wherein the transition metal compound is treated with an organometallic compound.

16. The process of claim 15 wherein the organometallic compound is an organoaluminum compound, an organoboron compound, an organomagnesium compound, an organozinc compound or an organolithium compound.

17. A process for polymerizing or copolymerizing olefins in the presence of a catalyst composed of

(A) a compound of a transition metal of Group IVB of the periodic table,

(B) an aluminoxane in a concentration of not more than 3 milligrams/liter as aluminum atom in the reaction system, and

(C) an organoaluminum compounds having a hydrocarbon group other than n-alkyl groups.

V. ☐ OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE "

This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. ☐ Claim numbers ..... because they relate to subject matter " not required to be searched by this Authority, namely:
2. ☐ Claim numbers ..... because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out ....., specifically:

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING "

This International Searching Authority found multiple inventions in this international application as follows

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application.
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims, it is covered by claim numbers
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee

Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest
- ☐ No protest accompanied the payment of additional search fees
